

Creating Project Folder

Overview

The DarshanEase project is organized using a modular folder structure that separates the frontend, backend, and documentation. This structure improves code organization, simplifies maintenance, and supports scalable development.

Step 1: Create the Main Project Folder

Create a root folder for the project.

DarshanEase/

Step 2: Create the Frontend Folder

The frontend is developed using **React.js**, **TypeScript**, and **Tailwind CSS**.

DarshanEase/
└── frontend/

Initialize the React project:

```
npx create-vite@latest frontend --template react-ts
```

Install dependencies:

```
cd frontend
```

```
npm install
```

Step 3: Create the Backend Folder

The backend is developed using **Node.js**, **Express.js**, and **MongoDB**.

DarshanEase/
├── frontend/
└── backend/

Initialize the backend project:

```
mkdir backend
```

```
cd backend
```

```
npm init -y
```

Install required packages:

```
npm install express mongoose cors dotenv jsonwebtoken bcryptjs
```

```
npm install --save-dev nodemon
```

Step 4: Create the Folder Structure

DarshanEase/

Step 5: Configure Environment Variables

Create a **.env** file inside the **backend** folder.

PORT=5000

MONGODB_URI=your_mongodb_connection_string

JWT_SECRET=your_secret_key

Step 6: Start the Development Servers

Backend

cd backend

npm run dev

Frontend

cd frontend

npm run dev

Project Organization Benefits

- Clear separation between frontend and backend.
- Easy maintenance and debugging.
- Scalable architecture for future enhancements.
- Organized source code for team collaboration.
- Simplified deployment and version control.

Conclusion

A well-structured project folder is essential for efficient development and maintenance. By separating the frontend, backend, configuration files, and documentation, the DarshanEase project becomes easier to manage, extend, and deploy while following industry-standard development practices.
